

Branch

1. Feature Overview

Branch master (codes, name, address, IFSC-like metadata). **Not implemented** as a module. Accounts store free-text `branchCode` (often hardcoded `0001`).

Status: Stub / Planned

2. Business Purpose

Multi-branch operations, reporting by branch, validated branch codes in account numbers.

3. User Workflow

Planned: ADMIN maintains branches; account open selects branch from list.

4. Execution Flow

Today:

```
OpenAccountRequest.branchCode (string)
    ↓
AccountNumberGenerator.generate(branchCode, ...)
```

5. Database Tables

None. Planned: `branch`

6. REST APIs

None. Planned: `/branches` CRUD

7–13. Controllers / Services / Repositories / DTOs / Entities / Utils / Config

None

14. Validation Rules

Today: none beyond non-null string on open. Planned: FK exists and active.

15. Security Rules

Planned: ADMIN write; broader read

16–18. Exception / Logging / Audit

N/A

19. Testing Strategy

When built: reject unknown branchCode on open account

20. Future Extension Guide

Add `branch` entity; migrate existing `account.branch_code` values; wire Open Account / Customer create dialogs.

Future Modification Guide

Requirement: Add branch master and validate on open

Item	Detail
Files	New <code>com/bankone/branch/**</code> ; <code>AccountServiceImpl.openAccount</code> ; Angular account/customer dialogs
Classes	<code>BranchController</code> , <code>BranchService</code> , <code>AccountServiceImpl</code>
Methods	<code>openAccount()</code> — <code>branchRepository.findByCode</code> before generate
Impact	Account number generation; reports; employee home- branch later

Call hierarchy (target)

```
AccountController.openAccount()  
    ↓  
AccountServiceImpl.openAccount()  
    ↓  
BranchService.requireActive(branchCode)  
    ↓  
AccountNumberGenerator.generate()  
    ↓  
AccountRepository.save()
```
