

Loan

1. Feature Overview

Full loan product (sanction, disbursement, EMI, interest, collateral) is **not** implemented. Only `AccountType.LOAN` exists on the Account module, plus a UI “Add Loan Account” affordance. No LOAN row in `AccountPolicyInitializer` seed.

Status: Partial (account type only)

2. Business Purpose

Eventually manage lending products separately from deposit accounts while optionally linking a LOAN account for disbursement/repayment postings.

3. User Workflow

Today: Customer detail → Add Loan Account may attempt open; likely fails policy lookup until policy exists.

Planned: Loan application → approval → disbursement → schedule.

4. Execution Flow

Today reuses Account open flow with `AccountType.LOAN`.

5. Database Tables

None dedicated. Uses `account` if a LOAN account is opened.

6. REST APIs

None loan-specific; uses `POST /accounts`

7–13. Controllers / Services / ...

None under a loan package. Account classes apply.

14. Validation Rules

Account policy required for open — **no LOAN seed** → open fails until policy created via API.

15. Security Rules

Same as accounts when using account APIs

16–18. Exception / Logging / Audit

Same as Account module

19. Testing Strategy

- Document failure without policy
- After `POST /account-policies` for LOAN/INR, open succeeds as generic account only

20. Future Extension Guide

Do not overload `account` forever — introduce `loan_application`, `loan_account` link, schedule tables; disbursement posts via Transaction module.

Future Modification Guide

Requirement: Allow opening LOAN accounts like CURRENT

Item	Detail
Files	<code>AccountPolicyInitializer.java</code> or POST policy; <code>customer-detail.ts</code> (opening deposit dialog)
Classes	<code>AccountPolicyInitializer</code> , <code>AccountPolicyServiceImpl</code> , UI detail component
Methods	Seed/ <code>createPolicy</code> ; reuse <code>getActivePolicy('LOAN')</code> + dialog pattern from Current
Impact	Still not a loan product — balances only

Requirement: Build real loan domain

Item	Detail
Files	New <code>com/bankone/loan/**</code> ; SecurityConfig; Angular features
Impact	Transaction disbursement/repayment; Reports; Audit; Account may hold disbursement account only

Call hierarchy (today)

```
UI addLoanAccount()  
  ↓  
AccountController.openAccount()  
  ↓  
AccountServiceImpl.openAccount()  
  ↓  
AccountPolicyRepository (may miss LOAN)
```
