

Account

1. Feature Overview

Open accounts under a customer, enforce account policies (opening deposit / min balance metadata), search accounts, update status, and post simple deposits that credit balances.

Status: Implemented for open / search / get-by-id / status / deposit / policies / transaction list API. Deposit now writes a **CREDIT** row via `TransactionService.record`. No withdraw/transfer; transaction list API exists; no ledger UI yet.

2. Business Purpose

Hold customer balances and product types (SAVINGS, CURRENT, SALARY, FD, RD, LOAN) with branch-coded account numbers.

3. User Workflow

- 1. `/app/accounts` — search list, Deposit action
- 2. Customer detail — Add Current (loads policy → opening deposit dialog if required) / Add Loan
- 3. Customer create — optional first account
- 4. Policies seeded at startup; create policy via API

4. Execution Flow

See [CALL_FLOW.md](#), [deposit](#), [get active account policy](#).

5. Database Tables

Table	Purpose
<code>account</code>	Balances, status, number parts
<code>account_policy</code>	Per type+currency rules
<code>account_ordinal_seq</code>	Ordinal for number generation
<code>customers</code>	Owner FK

6. REST APIs

Method	Path	Roles
POST	/accounts	ADMIN, EMPLOYEE
GET	/accounts	ADMIN, EMPLOYEE, MANAGER
GET	/accounts/customer/{customerId}	ADMIN, EMPLOYEE, MANAGER
GET	/accounts/{accountId}	ADMIN, EMPLOYEE, MANAGER
GET	/accounts/{accountId}/transactions	ADMIN, EMPLOYEE, MANAGER
PUT	/accounts/{accountId}/status	ADMIN, EMPLOYEE
POST	/accounts/{accountId}/deposit	ADMIN, EMPLOYEE
POST	/account-policies	Authenticated*
GET	/account-policies?accountType¤cyCode	Authenticated*

*Restrict to ADMIN — deferred hardening.

7. Controllers

- AccountController
- AccountPolicyController

8. Services

- AccountService / AccountServiceImpl — openAccount, getAccountById, getAccountsByCustomerId, updateAccountStatus, deposit, searchAccounts; transactions via TransactionService.getByAccountId
- AccountPolicyService / AccountPolicyServiceImpl — createPolicy, getActivePolicy
- AccountPolicyInitializer — seed INR policies

9. Repositories

- AccountRepository (+ getNextOrdinal() native query)
- AccountPolicyRepository

10. DTOs

OpenAccountRequest, AccountResponse, UpdateAccountStatusRequest, DepositRequest, CreateAccountPolicyRequest, AccountPolicyResponse

11. Entities / Enums

- `Account` , `AccountPolicy`
- `AccountType` , `AccountStatus` , `CurrencyCode`

12. Utility Classes

- `AccountNumberGenerator.generate(...)`
- `AccountSpecification.matching(...)`

13. Configuration Classes

`SecurityConfig` matches for `/accounts/**`; policy paths fall under `anyRequest().authenticated()`.

Frontend: `core/services/account.ts` , `account-policy.ts` , `features/accounts/` , `features/opening-deposit-dialog/`

14. Validation Rules

- Open: customer exists; active policy in effective window; if `openingDepositRequired` then amount $\geq$ `requiredOpeningDeposit`
- Deposit: account ACTIVE; amount positive
- Policy create: Bean Validation on `CreateAccountPolicyRequest`

15. Security Rules

Account mutations ADMIN/EMPLOYEE; reads include MANAGER. Policy endpoints currently any authenticated user.

16. Exception Handling

Business exceptions for missing account/customer/policy and validation failures $\rightarrow$ `GlobalExceptionHandler`.

17. Logging

SQL debug in dev; no structured account event log.

18. Audit Events

Account has `created_by` / timestamps; `AccountPolicy` uses `AuditableEntity`. Post-open deposits also write an immutable `bank_transaction` CREDIT via `TransactionService.record`.

19. Testing Strategy

- Open CURRENT with deposit $< 5000 \rightarrow$ reject
- Open CURRENT with $\geq$ policy min $\rightarrow$ balances equal deposit
- Deposit on ACTIVE $\rightarrow$ balances and `creditCount` increase
- Deposit on non-ACTIVE $\rightarrow$ reject
- GET policy CURRENT/INR returns seed row

- UI: Add Current opens dialog when required

20. Future Extension Guide

- Persist ledger on openAccount + withdraw/transfer (deposit CREDIT done)
- Withdraw / transfer with limits
- Account detail page
- Status transition state machine
- Seed LOAN policy or block LOAN until product module exists
- Maker-checker for large deposits

Future Modification Guide

Requirement: Increase required opening deposit for CURRENT/INR

Item	Detail
Prefer	Update/insert <code>account_policy</code> row (API <code>POST /account-policies</code> or DB) — not hardcode UI
Files	<code>AccountPolicyInitializer.java</code> (seed), or runtime policy via <code>AccountPolicyServiceImpl.createPolicy</code>
Classes	<code>AccountPolicy</code> , <code>AccountPolicyServiceImpl</code>
Methods	<code>createPolicy()</code> , <code>getActivePolicy()</code> ; enforced in <code>AccountServiceImpl.openAccount()</code>
Impact	<code>OpeningDepositDialog</code> min; customer onboarding amounts

Requirement: Change deposit to write a ledger entry

Done (deposit path): `AccountServiceImpl.deposit()` calls `TransactionService.record(..., CREDIT, ...)` after balance update. Still TODO: opening CREDIT on `openAccount`; withdraw/ transfer; ledger UI; dashboard `todayTransactionCount`.

Item	Detail
Files	<code>AccountServiceImpl.java</code> , <code>com/bankone/transaction/**</code>
Methods	<code>deposit()</code> → <code>transactionService.record(...)</code>
Impact	Ledger table populated on deposit; dashboard count still stub

Requirement: Change account number format

Item	Detail
Files	AccountNumberGenerator.java , possibly AccountServiceImpl.openAccount
Methods	generate(branchCode, accountType, ordinal, currency, checkDigit)
Impact	Display/search only for new accounts; old numbers unchanged

Requirement: Allow deposit on FROZEN accounts

Item	Detail
Files	AccountServiceImpl.java
Methods	deposit() status check
Impact	Status rules doc; UI Deposit button enablement

Call hierarchy (open account)

```
AccountController.openAccount()
    ↓
AccountServiceImpl.openAccount()
    ↓
CustomerRepository.findById()
    ↓
AccountPolicyRepository.findByAccountTypeAndCurrencyCodeAndActiveTrue()
    ↓
AccountRepository.getNextOrdinal()
    ↓
AccountNumberGenerator.generate()
    ↓
AccountRepository.save()
```

Call hierarchy (deposit)

```
AccountController.deposit()
    ↓
AccountServiceImpl.deposit()
    ↓
AccountRepository.findById()
    ↓
TransactionService.record(..., CREDIT, ...)
    ↓
TransactionRepository.save()
    ↓
AccountRepository.save()
```
